AI Agent Appendix: No AI Agent was used in the making of this document, specifically, no Agent was used by any team members to write the team charter or agent protocol.

Team Charter: Almanac

Group Members:

- Addison Broschell
- Arianna Wallace
- Harveen Harveen
- Leo Goebel
- Aithan McIntyre

Communication and Meetings:

- We will meet in our assigned lab section on Wednesdays from 11:30 - 2:20.
- If we need additional time to work on our assignment, we will schedule extra meetings when they are needed.
- We have each other's full schedule, so we can schedule extra meetings around our schedules.
- We will be using text messages and emailing to reach out to each other in between meetings.
- Everyone will clearly communicate if they are failing behind or require help.
- Group members will answer methods of communication within reason.

Roles and Workload:

- We will evenly distribute the tasks, as well as have weekly check-ins so that no one will fall behind.
- Tasks will be given in favour of group members strengths and their ability to effectively contribute to the assignment.
- If there are any issues with the divided workload, as a group we will redistribute the tasks to make sure everyone is successful.
- Workload will be clearly and honestly reflected in peer reviews.
- Roles will be chosen by the group members through discussion and volunteering for contributions.

Decisions and conflict:

- Every decision has to go through all group members before it becomes final.
- If there is any doubt or uncertainty, the group will have a conversation and decide what the best way to proceed is.
- We want to make sure every decision and idea is considered by all group members, so every member gets a say in the group work.
- If there are any personal conflicts within the group they will be handled privately among those members, if problems start to harm group work as a whole the issue will be handled by the entire group and teaching if necessary.

Definition of done:

- When every member of the group has checked over the grading scheme and compared it to the deliverable.
- When everyone agrees that it matches the rubric to the best of our abilities it will be submitted.
- The group has met in person and gone through the assignment before it is submitted, if there are issues we work on it together.
- Before the presentation days, we will meet as a team; in-person at least twice to run through our content to ensure every member is familiar with what is being presented.
- Each member has affirmed that their contribution is complete before the group meeting takes place.

Git and GitHub workflow:

- Never make and commit changes directly to the main branch, always work on a separate branch and push to the main once your code is error free to avoid ruining the code base.
- Code is to be commented and properly documented, anything that is in progress of being completed should be marked so that it doesn't get forgotten within the code base.
- We will use the same naming conventions, formatting, and commenting practices within the code base so that every part stays consistent and can be understood by every member.
- We will use a combination of pair programming methods and solo coding to ensure the code base stays proper and working.

Agent Protocol

Which Agents/ Tools:

- We will mainly use copilot, as that is provided by the university and thus all team members will have equal access to it. It will also ensure that our help and knowledge from the AI is consistent.
- If needed, we will use a secondary agent. We will use Gemini, as it is made by google and widely available.

What will you delegate to an AI agent and why:

Perhaps help with:

- Explaining unfamiliar code and suggesting debugging approaches
- Helping with repetitive code
- Building test cases
- Explaining error messages

AI is useful for these low risk coding tasks because it can save time by helping developers understand problems, and help provide suggestions without making decisions for the project. In addition it can explain unfamiliar code, help find possible causes of errors which allows the team to focus on more important tasks at hand.

What will you not delegate to an AI agent and why:

As a Team we will not delegat**e:**

- Allowing the AI to write critical parts of the project without review
- Submitting AI generated work without verifying it
- Overall design and Architecture decisions

AI does not have a functionality to think, every output is generated by scripts. This is why any main function of writing and high-level intelligence work will not be given to the AI. As well the team will ensure that each and every line and design has been done without AI involvement.

How you will verify agent output before it is merged:

- We will cross reference with other AI agents
- We will google and check online documentation
- We will reference other code that does the same function
- We will have group members read over the agent generated code and understand the function and purpose of the code.
- We will ensure agent generated documentation is readable and matches the code function.

How you will declare agent use:

- At the bottom of every page / deliverable a statement will be included stating that no AI was used or declaring the use of Agent and how it was used.
- If we are declaring that an Agent was used, we will be very clear and specific to highlight where and how we used it.
- Additionally, we will include what prompt the AI was given, what we used and what we did not.
